

# WHEEL OF FORTUNE

How often do you expect the wheel to land on each of the following amounts?

Tier A

Ask One, Explain...

1. In the game show *Wheel of Fortune*, contestants spin a wheel to determine how much money they will win. To the nearest percent, how often do you expect the wheel to land on each of the following amounts?

Amount	\$300	\$350	\$400	\$450	\$500
Pieces	$\frac{5}{24}$ <i>5 \$300 on board</i>	$\frac{1}{24}$	$\frac{1}{24}$	$\frac{1}{24}$	$\frac{3}{24}$
Percent	21%	4%	4%	4%	13%
Amount	\$550	\$600	\$700	\$800	\$900
Pieces	$\frac{1}{24}$	$\frac{2}{24}$	$\frac{1}{24}$	$\frac{1}{24}$	$\frac{2}{24}$
Percent	4%	8%	4%	4%	8%
Amount	\$3500	\$1 million	Free Play	Lose Turn	BANKRUPT
Pieces	$\frac{1}{24}$	$\frac{1}{24}$	$\frac{1}{24}$	$\frac{1}{24}$	$\frac{2}{3}$
Percent	4%	1%	4%	4%	11%

2. Pick one of the percents above and explain what it means within the context of *Wheel of Fortune*.

If you spin \$1 million what does that mean?

You were very lucky because the chance of getting \$1 million is only 1%.

3. If you watched an episode of *Wheel of Fortune*, what would need to happen for you to be suspicious that the show was rigged? Explain.

When would you think something's not right with this?

If a contestant gets bankrupt 50% of the time.

## Act Two: Wheel of Fortune

5. On the first page, you figured out the theoretical probability of getting each outcome on the Wheel of Fortune. Now you will be watching the episode (you have been given the link) and recording the experimental probability. While watching this episode, be sure to change the speed to 0.5 and record the results of the spins on the chart below. Put tally marks in the chart below each time the amount is spun. Some of the spins land on bonuses, which are cards on top of one of these amounts, so look carefully! After the game is finished, compute the percentages of each amount.

\$300 Tally marks →       Percent: $\frac{4}{27} = 14.8\%$	\$350   Percent: $\frac{1}{27} = 3.7\%$	\$400    Percent: $\frac{2}{27} = 7.4\%$	\$450   Percent: $\frac{1}{27} = 3.7\%$
\$500       Percent: $\frac{5}{27} = 18.5\%$	\$550 Percent: _____	\$600   Percent: $\frac{1}{27} = 3.7\%$	\$700     Percent: $\frac{3}{27} = 1.1\%$
\$800 Percent: _____	\$900     Percent: $\frac{3}{27} = 1.1\%$	\$3,500 Percent: _____	\$1 million Percent: _____
Free Play    Percent: $\frac{2}{27} = 7.4\%$	Lose a Turn   Percent: $\frac{1}{27} = 3.7\%$	Bankrupt       Percent: $\frac{4}{27} = 15\%$	Total Spins 27

6. Compare the theoretical and experimental probability of spinning \$500 on the wheel.

theoretical of \$500 → 4%  
experimental of \$500 → 18.5%

Compare:  
Experimental is much higher than the theoretical. This is probably because there were not a lot of trials.

7. Compare the theoretical and experimental probability of spinning "bankrupt" on the wheel.

Theoretical - 11%

Exp - 15%

These are pretty close.

8. Based on your results, do you think the game show, Wheel of Fortune, is rigged? Why or why not?

Do you think it is fair?

Yes, because the # of bankrupts in the experimental is not so different from the theoretical.
